

Indiana Dentist Rescues the Dentally Fearful Patients with Sedation Dentistry at the Center for Implants, Sedation and Cosmetic Dentistry

Going to the Dentist doesn't have to be a fearful or a bad experience. Millions of people avoid going to the Dentist due to fear and anxiety. Rest assure there is a solution. Dr. Irfan (Ivan) Atcha's Sedation Dentistry Method at the Center for Implants, Sedation and Cosmetic Dentistry can help as it has help the fearful regain their confidence about going to the Dentist and are smiling again!

Dyer, IN ([PRWEB](#)) February 16, 2009 -- Advances in Sedation Dentistry allow many procedures to be done by a advanced trained Sedation Dentist like Dr. Irfan(Ivan)Atcha at the Center of Implants, Sedation and Cosmetic Dentistry www.BestIndianaDentist.com without the need for referrals to specialists. This means Dr. Atcha can provide his patients with complete treatment plans and see to your care from start to finish. Even root canals, crowns, implants, and periodontal (gum) work can be done by a advanced trained Sedation Dentst like Dr. Atcha who has received the proper training in various Sedation methods such as Oral, IV and General anesthesia.

Sedation dentistry not only creates a relaxing and anxiety-free experience for the public, it also allows Dr. Atcha to accomplish more dentistry in a single visit - meaning his patients have to return fewer times to complete their treatment and regain their oral health back.

Whether our patients require a single filling or are looking to have their entire smile restored, sedation dentistry can help patients achieve optimum dental health in the most comfortable way possible.

However there are cold hard facts patients must know about Sedation Dentistry and Sedation Dentists says Dr. Atcha:

What is Sedation Dentistry? It has become very popular for dental practices to market the terms sedation and sleep dentistry. Sedation or sleep dentistry have different meanings to dentists and patients.

Most patients do not know that there are different levels of training that dentists are legally required to obtain in order to provide basic to advanced levels of sedation and anesthesia. Dentists can provide oral sedation (pills), conscious sedation (intravenous medications), or general anesthesia (true sleep) provided they are properly trained and licensed.

Only a few select dentists like Dr. Atcha in this country are advanced trained and licensed to provide complete anesthesia. "Our patients will not respond or recall even the most noxious procedures". "There are different types of sedation methods that pateints should be aware of," says Atcha as there is so much hype about dentist jumping on the Sedation Dentistry band wagon and advertise themselves as sedation dentists.

Most dentists that only provide oral sedation, advertise sedation with just a single pill. These oral medications are only effective in individuals that are mildly anxious. Very anxious or phobic patients never achieve their desired level of comfort. Oral sedation can actually make an anxious patient more uncooperative. "Contrary to advertised claims, patients are not asleep with oral sedation", Says Atcha " For a patient to be asleep with oral sedation, they must be overdosed! This places them at risk, especially since only minimal patient monitoring is present or utilized in offices that advertise oral sedation." A dentist need only attend a weekend course to be able to provide oral sedation in their practice.

A few dentists are trained to provide IV, or intravenous sedation for their patients. IV sedation can provide a much better patient experience because medications are administered directly into the bloodstream through an intravenous line. Despite claims that a patient will be asleep, they are legally required to remain conscious. Patients must realize that they will be relaxed but not asleep. Dentists are only required to complete 60 hours of training, pass a test, and pass an on site inspection to receive a permit.

General anesthesia is the only anesthetic state where the patient can be considered completely sleep. Throughout the nation, only a very small number of dentists have residency training, knowledge, and a license to provide patients with general anesthesia like Dr. Atcha at his Center for Implants, Sedation and Cosmetic Dentistry. Medications can be administered intravenously or through gases inhalational agents. Patients are asleep, amnesic and stress free during procedures. Imagine having a root canal and the patient never feel, hear or remember anything! "Dentists must complete a residency in anesthesiology and pass periodic on site inspections to receive a permit to administer general anesthesia". Says Atcha.

Above all else, patients safety comes first as Dr. Atcha and his anesthesia assistant are properly trained in administration of anesthesia and monitoring of the patient from start to finish. Oral Sedation, IV Sedation and General anesthesia can be performed in their licensed surgical/sedation center in Dyer IN as they are the only surgical/sedation center in the area that provides all the services under one roof. "No multiple providers are needed for our patients to incur extra cost to our patients" says Dr. Atcha who performs the anesthesia and also the dental procedures on the patients himself!

Now is the time to take advantage of the many benefits of sedation dentistry. Patients can have all their dental work in fewer visits and the visits can be very comfortable. Best of all patients will have no memory of the visits. Dr. Irfan (Ivan) Atcha, a sedation-trained advanced dentist, (ACLS certified) that can deliver the care and attention his patients deserve - and the smile his patients have always dreamed of.
